

RUGBY SURFACES

The increasing market demand for surfaces that specifically match the playing performance of natural grass has led to the development of new generations of synthetic grass for rugby.

These surfaces have a much longer pile than the standard range and are partially filled with a rubber and sand mix. These surfaces offer enhanced playing qualities for rugby.

The advantages of using this type of surface are as follows:

- Manufactured in the UK
- Best quality raw materials
- Surfaces meet specifications set at amateur and professional levels
- Natural look, feel and comfort
- Excellent pile anchoring
- Increased durability for a constant playing surface over the years
- Stability and safe moving and turning for players
